Summary

As a full stack web developer, I have experience building projects in both front-end and back-end development. My specialization lies in back-end development using PHP and Laravel. Throughout my coding journey, problem solving has been a constant passion of mine. I embarked on my coding journey during my teenage years, initially as a hobby. Now, equipped with a strong foundation, I am eager to transition into the professional realm of web development.

Skills

- HTML 5
- CSS/SASS
- Bootstrap 5
- Git/GitLab
- PHP
- MySQL
- Laravel 9
- JavaScript

Projects

[JadiDomashno](#)

I developed an online store for homemade dishes as a project for a client during my time at the coding bootcamp. My role in the project was to build the back-end using Laravel. The platform allows users to register as either a chef or a gourmet. As a chef, users can edit their profiles, manage their recipes using a CRUD interface, and indicate their availability for orders. As a gourmet, users can add recipes to their cart and place orders. Once an order is placed, the chef receives an email notification. Additionally, an admin dashboard allows for user account management, with the ability to deactivate or activate users as needed.

[BrainsterLibrary](#)

This project resembles an online library management. The project is responsive, build using PHP, JavaScript and Ajax. A user can register/login, add notes to books(CRUD is done using Ajax), add a comment on them and filter books by category. There is also an admin panel where he has a CRUD for books, authors and categories and can approve and unapprove comments.

[CMS-Project](#)

A project that i have built in my spare time. This project is a simple CMS that is build in PHP. A user can register and login and has a CRUD for blog posts. There is also an admin panel that has a CRUD for all posts, and can make a post featured or not. It's also responsive.

[BrainsterLabs](#)

Simple responsive animated web application that is build using JavaScript. It has a simple card filter and a form validation. First project built in the bootcamp.
